

NinaivX

A voice app to talk with the people who matter — even those we've lost.

You speak, and an AI answers back in a real human voice — like a phone call.

In one sentence: NinaivX lets a person hold a natural, spoken conversation with an AI — either a caring **companion** for someone who feels lonely, or a comforting recreation of a **loved one who has passed away**, speaking in a voice you choose or even their own cloned voice.

Who it is for — two kinds of conversation

The Loved One (Legacy)

For someone grieving. They can talk to an AI version of a person who has passed away — to feel close again, say the things left unsaid, and find comfort and closure.

 Kept offline so it can never invent false things about the person

The Companion

For someone lonely. A warm, supportive friend available any time, that listens and talks naturally — and can even chat about today's news or weather.

 Connected to the internet for up-to-date conversation

Getting started (done once)

- 1 Create an account and sign in.** Simple email and password — this keeps every person's data private and separate.
- 2 Describe the person.** Their name, personality, and how they spoke — this is what makes the AI feel like them.
- 3 Choose a voice.** Say the kind of voice you want (for example a man or woman, younger or older) and pick from the options — or upload a short clip to **clone their real voice**.

How one conversation works

The clever part — the “brain” makes a safety decision. Before replying, the app checks who you are talking to. If it is a **loved one**, it stays completely offline, so it can never make up false “facts” about a real person who has died. If it is a **companion**, it is allowed to look things up online. This safety choice is the heart of the project.

Our promises to the user

Private

Your conversations and the person's details are protected, and each user only ever sees their own.

Honest

The app always makes clear it is an AI — it will never pretend to truly be the real person.

Gentle

Built to support healthy grieving and comfort — not to replace the person or trap you.

Progress: the **backend (the engine and brain) is built and tested ✓** · Next: the app screens people tap on, and putting it online. · Ashwin Kumar Ramesh Kumar — MSc AI, University of Sheffield
